TITLE: Design of reflector fixtures with gas-discharge lamps

SOURCE: Svetotekhnika, no. 6, 1966, 7-12

TOPIC TAGS: lighting equipment, fluorescent lamp

ABSTRACT: Graphs are plotted and tables are compiled which may be used for determining the angular dimensions of elementary reflections and finding the luminous flux from gas-discharge lamps incident on the reflector in lighting fixtures. Data on the angular dimensions of the elementary reflection are determined by the method developed by V. V. Trembach (*Svetotekhnika*, 1957, No 7) treating the luminescent surface of the lamp as a spheroid with the minor semiaxis equal to the radius of the lamp and the major semiaxis equal to half the length of the section of the lamp which is covered by the phosphor. It is shown that a plane section of the elementary reflection in this case is an ellipse. The major and minor semiaxes of this ellipse are tabulated in the longitudinal and transverse planes for angles of the midpoint of the reflector zone from 25 to 85° and various relative distances between the midpoint of the reflector zone and the center of the lamp. Similar analytical methods are used for determining the luminous flux incident on the reflector. Examples are given showing application of the tables and graphs to solution of practical problems. Orig. art. has: 7 figures, 5 tables, 19 formulas.

ORG: Cytopathological Laboratory, Institute of Epidemiological and Microbiological Research

TITLE: Morphological aspect of the toxic effect of the contamination of cell cultures by the type 14 adenovirus

SOURCE: Bulgarska akademiya na naukite. Doklady, v. 18, no. 10, 1965, 963-966

TOPIC TAGS: cytology, toxicology, virus, pathogenesis, morphology

ABSTRACT: The cytopathogenic effects caused by adenovirus are noticeable either during their reproduction or before reproduction by a so-called "toxic effect." The present paper reports in detail on the cytologic and cytochemical investigations of the dynamics of the embryonic human kidney cell modifications appearing during the proliferation of the type 14 adenovirus as well as those changes caused by the toxic effect. Observations were carried out 6, 12, 18, 48, 72, and 96 hours after contamination. The article concludes with a detailed discussion of the results which are, in general, in good agreement with the results of other authors. Orig. art. has: 4 figures.

Title : Delaying Germination in Potato Tubers with the Aid of Synthetic Chemical Substances.

Orig Pub : Ovoshcharstvo i gradinarstvo, 1956, No 5, 48-53

Abstract : An investigation was made into the effectiveness of the chemical preparation developed in Bulgaria under the name of NES for delaying germination in potato tubers to be used in summer planting. Positive results were achieved. The NES preparation delays germination of the eyes and does not reduce the qualities of the tubers as seed. When treated the tubers give between 15 and 47% increase in yield. One kilogram of preparation is used for each 100 kilograms of potatoes.

Carbutamide, tolbutamide and derivatives were administered to 32 tuberculous diabetics. Combined therapy gave successful results in both diseases. The effect on diabetes was excellent in 12 patients (37.5%), favourable in 8 patients (25%), average in 6 patients (15.74%), and without any result in a further 6 patients (15.74%). Excellent results were obtained chiefly in patients with diabetes of the counter-regulation type and in those with recent diabetes. Also patients who had been suffering from diabetes for 10, 20 or more yr. showed favourable results.

TITLE: Laboratory application of controllable directed reception in the seismic surveying method of refracted waves

PERIODICAL: Referativnyy zhurnal, Geofizika, no. 12, 1961,
28, abstract 12A278 (Tr. Mosk. in-ta neftekhim.
i gaz. prom-sti, 1960, no. 31, 118-130)

TEXT: The laboratory processing of seismograms, obtained during operations by the correlation refraction method on the North Bulgarian Uplift under conditions of alternating beds of high-velocity limestones and dolomites, was carried out by the method of controllable directed reception. Zones of interference of waves with border speeds of 4550, 5600, and 6200 m/sec., whose tracking by the usual procedure of the correlation refraction method entails certain difficulties, were successfully
